

SpaceX_Machine Learning Prediction_Part_5

June 21, 2022

1 Space X Falcon 9 First Stage Landing Prediction

1.1 Assignment: Machine Learning Prediction

Estimated time needed: **60** minutes

Space X advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, much of the savings is because Space X can reuse the first stage. Therefore if we can determine if the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against space X for a rocket launch. In this lab, you will create a machine learning pipeline to predict if the first stage will land given the data from the preceding labs.

Several examples of an unsuccessful landing are shown here:

Most unsuccessful landings are planed. Space X; performs a controlled landing in the oceans.

1.2 Objectives

Perform exploratory Data Analysis and determine Training Labels

- create a column for the class
- Standardize the data
- Split into training data and test data

-Find best Hyperparameter for SVM, Classification Trees and Logistic Regression

- Find the method performs best using test data

1.3 Import Libraries and Define Auxiliary Functions

We will import the following libraries for the lab

```
[1]: # Pandas is a software library written for the Python programming language for
    ↪ data manipulation and analysis.
import pandas as pd
# NumPy is a library for the Python programming language, adding support for
    ↪ large, multi-dimensional arrays and matrices, along with a large collection
    ↪ of high-level mathematical functions to operate on these arrays
import numpy as np
```

```

# Matplotlib is a plotting library for python and pyplot gives us a MatLab like
↳plotting framework. We will use this in our plotter function to plot data.
import matplotlib.pyplot as plt
#Seaborn is a Python data visualization library based on matplotlib. It
↳provides a high-level interface for drawing attractive and informative
↳statistical graphics
import seaborn as sns
# Preprocessing allows us to standarsize our data
from sklearn import preprocessing
# Allows us to split our data into training and testing data
from sklearn.model_selection import train_test_split
# Allows us to test parameters of classification algorithms and find the best
↳one
from sklearn.model_selection import GridSearchCV
# Logistic Regression classification algorithm
from sklearn.linear_model import LogisticRegression
# Support Vector Machine classification algorithm
from sklearn.svm import SVC
# Decision Tree classification algorithm
from sklearn.tree import DecisionTreeClassifier
# K Nearest Neighbors classification algorithm
from sklearn.neighbors import KNeighborsClassifier

```

```

```
[90 rows x 83 columns]
```

Create a NumPy array from the column `Class` in `data`, by applying the method `to_numpy()` then assign it to the variable `Y`, make sure the output is a Pandas series (only one bracket `df['name of column']`).

```
[5]: array([0, 0, 0, 0, 0, 0, 1, 1, 0, 0, 0, 0, 1, 0, 0, 0, 1, 0, 0, 1, 1, 1,  
          1, 1, 0, 1, 1, 0, 1, 1, 0, 1, 1, 1, 0, 1, 1, 1, 1, 1, 1, 1, 1])
```

```
1, 0, 0, 0, 1, 1, 0, 0, 1, 1, 1, 1, 1, 1, 1, 0, 0, 1, 1, 1, 1, 1,
1, 0, 1, 1, 1, 1, 0, 1, 0, 1, 0, 1, 1, 1, 1, 1, 1, 1, 1, 1, 1,
1, 1])
```

1.6 TASK 2

Standardize the data in X then reassign it to the variable X using the transform provided below.

```
[8]: # students get this
transform = preprocessing.StandardScaler()
```

```
[10]: X = transform.fit(X).transform(X.astype(float))
X[0:5]
```

```
[10]: array([[ -1.71291154e+00,  -5.29526321e-17,  -6.53912840e-01,

1.93309133e+00, -1.93309133e+00]])
```

We split the data into training and testing data using the function `train_test_split`. The training data is divided into validation data, a second set used for training data; then the models are trained and hyperparameters are selected using the function `GridSearchCV`.

1.7 TASK 3

Use the function `train_test_split` to split the data X and Y into training and test data. Set the parameter `test_size` to 0.2 and `random_state` to 2. The training data and test data should be assigned to the following labels.

X_train, X_test, Y_train, Y_test

```
[11]: X_train, X_test, Y_train, Y_test = train_test_split( X, Y, test_size=0.2,
↳ random_state=2)
```

we can see we only have 18 test samples.

```
[12]: Y_test.shape
```

```
[12]: (18,)
```

1.8 TASK 4

Create a logistic regression object then create a `GridSearchCV` object `logreg_cv` with `cv = 10`. Fit the object to find the best parameters from the dictionary parameters.

```
[14]: parameters ={"C":[0.01,0.1,1], 'penalty':['l2'], 'solver':['lbfgs']}]# l1 lasso
↳ l2 ridge
lr=LogisticRegression()
logreg_cv = GridSearchCV(lr, parameters, cv=10)
logreg_cv.fit(X, Y)
```

```

```
scoring=None, verbose=0)>
```

Lets look at the confusion matrix:

```
[19]: yhat=logreg_cv.predict(X_test)
      plot_confusion_matrix(Y_test,yhat)
```

```
/home/jupyterlab/conda/envs/python/lib/python3.7/site-
packages/sklearn/linear_model/base.py:283: DeprecationWarning: `np.int` is a
deprecated alias for the builtin `int`. To silence this warning, use `int` by
itself. Doing this will not modify any behavior and is safe. When replacing
`np.int`, you may wish to use e.g. `np.int64` or `np.int32` to specify the
precision. If you wish to review your current use, check the release note link
for additional information.
```

Deprecated in NumPy 1.20; for more details and guidance:

<https://numpy.org/devdocs/release/1.20.0-notes.html#deprecations>

```
indices = (scores > 0).astype(np.int)
```

Examining the confusion matrix, we see that logistic regression can distinguish between the different classes. We see that the major problem is false positives.

1.10 TASK 6

Create a support vector machine object then create a GridSearchCV object svm_cv with cv - 10. Fit the object to find the best parameters from the dictionary parameters.

```
[20]: parameters = {'kernel':('linear', 'rbf','poly','rbf', 'sigmoid'),
                  'C': np.logspace(-3, 3, 5),
                  'gamma':np.logspace(-3, 3, 5)}

svm = SVC()
```

```
[22]: svm_cv = GridSearchCV(svm, parameters, cv=10)
      svm_cv.fit(X, Y)
```

alias for the builtin `int`. To silence this warning, use `int` by itself. Doing
this will not modify any behavior and is safe. When replacing `np.int`, you may
wish to use e.g. `np.int64` or `np.int32` to specify the precision. If you wish
to review your current use, check the release note link for additional
information.
```
